Two-column security handbook

1. Detection

Repeated authentication failures are detection signals, not proof that any account was compromised. Record the source address and affected account before drawing an incident conclusion.

The following numbered items are operational steps, not new document sections.

1. Check firewall configuration. 2. Collect authentication logs.

2. Response

Containment requires an explicit response decision. A recommendation to block a source is not evidence that a block has already been executed. Record any approval and verify the outcome.

Response recommendations must remain separate from observed event facts. No production commands are executed by this synthetic example.
